

ECP Data Management, Data Analytics, and Visualization Overview

Kenneth Moreland Sandia National Laboratories

ECP Annual Meeting March 30, 2021

This research was supported by the Exascale Computing Project (17-SC-20-SC), a joint project of the U.S. Department of Energy's Office of Science and National Nuclear Security Administration, responsible for delivering a capable exascale ecosystem, including software, applications, and hardware technology, to support the nation's exascale computing imperative.

Sandia National Laboratories is a multi-mission laboratory managed and operated by National Technology and Engineering Solutions of Sandia, LLC., a wholly owned subsidiary of Honeywell International, Inc., for the U.S. Department of Energy's National Nuclear Security Administration under contract DE-NA0003525.

Why VTK-m?

Visualization and Analysis for HPC: Current Status

- Developed popular, open source tools (ParaView, Vislt) based on the Visualization ToolKit library (VTK)
 - Widespread usage in DOE and >1 million downloads worldwide
 - Hundreds of person years of effort
- Two major problems for exascale:
 - 1) Many-core architectures (as current VTK-based investments are primarily only MPI parallelism)
 - 2) I/O limitations will require in situ processing

Scientific Visualization and Analysis Ecosystem for Large Data (VTK, ParaView*, Vislt*, Cinema, SENSEI, and VTK-m*)

Problem

- · Developed general-purpose, scientific visualization and analysis libraries and tools · designed with parallelism in mind to operate on world's largest data sets
- · collaborative open-source development model engaging multiple National Laboratories, universities, and industry

Impact

- · Leading visualization and analysis solutions for Department of Energy scientists
- Used on all ASCR supercomputing facilities, and worldwide inmost HPC facilities
- · Over 1 million downloads of software worldwide
- · Creates capability for DOE to look at data from the world's largest simulations

VTK-m: the 'm' is for many-core

- VTK:
 - popular, open source, supported by a community
 - ... but primarily single core only.
- VTK-m:
 - name chosen to evoke the positive attributes of VTK
 - ... but will support multi-core and many-core.
- VTK-m is the only DOE effort for many-core visualization.
 - Previously there were 3 predecessor projects, but the PI's of those projects decided to join forces in 2014 to make VTK-m.

Overall Strategy: A framework to write-once-run-everywhere

Recent Accomplishments

Capability Delivery

ЕСР Арр	ST Partner	Machine	Notes	
EQSIM:SW4	Alpine	Summit (384 GPUs across 64 nodes for Lagrangian, 2000 nodes for traditional algs)	Scale increased in FY20	
ExaSky:Nyx	Alpine	Summit (512 nodes with 1 MPI task per node and 1 GPU per MPI task)	Nyx on CPU with OpenMP	Sampling Rate = 0.1
PeleC	Alpine	Summit (64 MPI processes)	VTK-m on CPU with OpenMP	
WarpX	Alpine	Cori (1024 compute nodes, 65,536 cores with hyperthreading)	40X scaling improvement in FY20	<u>A</u> A
WarpX	Alpine	Summit (27,000 GPUs)	Featured in ISAV keynote	
MARBL	Alpine	Sierra (16,384 GPUs across 4096 nodes)		
WDMApp	ADIOS	Summit (100 nodes)	VTK-m incorporated in EFFIS	
External	LLNL	Sierra (16,384 GPUs across 4096 nodes)	This image is of an idealized Inertial Confinement Fusion (ICF) simulation of a Rayleigh–Taylor instability with two fluids mixing in a spherical geometry.

In Situ/In Transit Visualization with WarpX

- VTK-m is providing in situ capabilities to WarpX (using Ascent)
- Simulation run on 600 GPUs on Summit
 - Modeling a 10-stage laser-wakefield accelerator
- Functionality featured in keynote for ISAV 2020: Uses of In Situ/In Transit Methods in Large-Scale Modeling of Plasma-Based Particle Accelerators

Flow Visualization in WarpX Laser Wakefield Simulations

- Science Problem
 - The Exascale Modeling of Advanced Particle Accelerators (WarpX) project aims to answer outstanding questions in the physics of acceleration and transport of particle beams in chains of plasma channels. One of the core efforts in this project is the simulation of laser wakefields in plasma-based particle accelerators.
 - Modeling the flow of particles is critical to understanding the physics.
- Technical Solution
 - Unlike flow in typical fluids, the velocity of particles must be inferred from magnetic and electric fields by solving the Lorentz force equation.
 - The frame of reference of the simulation shifts to follow particle advancement, and the flow vectors must be translated to compensate.
 - VTK-m's flow visualization system was tailored to this application.
- Science Impact
 - The numerically accurate particle tracking provides numerous flow visualization techniques to better understand the flow in the simulated particle accelerators.

Streamlines depicting possible paths of particles in a laser wakefield.

Rendering of electrostatic potential and streamer features in the plasma.

Cuts are made in the plasma to highlight the edge coupling region.

In Situ Visualization in WDMApp Using VTK-m

- Science Problem
 - The Whole Device Model Application (WDMApp) project aims to develop a high-fidelity model of magnetically confined fusion plasmas, which is needed to plan experiments on ITER and optimize the design of future fusion facilities. One of the core efforts in this project is the development of a framework to couple two advanced and highly scalable gyrokinetic codes: XGC and GENE.
 - Large-scale simulations require real-time feedback on the current state.
- Technical Solution
 - Code coupling is facilitated by EFFIS, which orchestrates the codes and numerous analysis and visualization services. The ECP/VTK-m team incorporated an in situ visualization capability into EFFIS, which provides WDMApp with 3D renderings of the electrostatic potential within the plasma.
- Science Impact
 - These renderings provide near real-time insight to the running codes, as well as for post-run analysis. VTK-m is used for visualization and rendering. ADIOS is used for coupling with the running applications.

How Do I Use VTK-m?

Using VTK-m in ParaView

1. Load VTK-m Plugin

rs	Tools	Catalyst	Macros	Help
∩ 1 0 0 0 0 0 0 0 0 0 0 0 0 0	Ci A Li M M Ra Pl La La Ti	Catalyst reate Custo dd Camera nk with Sel lanage Cus lanage Link lanage Plug ecord Test lay Test ock View Si ock View Si imer Log	tion Filter Link ection tom Filters ss gins ze ze ze Custom

2. Use a VTK-m filter like any other

Using VTK-m in VisIt

1. Turn on VTK-m in Preferences

Preferences 🕒 🗎 😣					
Clone window on first reference					
Post windows when shown					
✓ Prompt before setting default attributes					
✓ Prompt before applying new operator					
✓ New plots inherit SIL restriction					
New plots automatically expanded					
Replace plots					
Enable warning message popups					
Floating point precision:					
• Float O Native	 Double 				
Parallel Computation Library:					
○ VTK	⊙ <mark>_VTKm</mark>				
Databases	~				
Try harder to get accurate cycles/times					

2. Use VTK-m-enabled plots as normal

Conclusion

- Let us know what further help you would like
 - Do you want a more focused, more in depth tutorial?
- Let us know how to prioritize our development
 - Is there something in particular you do a lot with ParaView, Vislt, Catalyst, Libsim, ASCENT, etc.?
 - Is there something that seems to be running slower in ParaView, Vislt, Catalyst, Libsim, ASCENT, etc.?
 - Is there functionality missing from ParaView, VisIt, Catalyst, Libsim, ASCENT, etc.?
